2) Problembeschreibung						
In material processing, we have noticed that our stampings always below the tolerance. Therefore, we have separated your liner						
from the foam and leave a few minutes. The foam is then pulled together, suggesting a strong tension in the foam. Please also refer to the annexed photographs.						
Aktion vom Kunde gefordert						

II. AUSWERTUNG UND AKTIONEN

Muster/Photo Erhalten	Yes

Bemerkungen							
1) Analyse							
Sample Roll received. Currently under test. Sample roll shows foam to be 4.5% less length than blue liner when a 200mm strip is cut from the sample. The blue liner is laminated into the adhesive / foam around a core. Therefore the blue liner goes around a longer path than the adhesive coated open face. The adhesive and foam are held in place by the release force of the blue liner to give an apparent even length. With the sample supplied by customer the foam appears to have shrunk back to its original length on outer wraps. Retained samples of same batch show 5 - 5.25% shrinkage. Previous shipment to customer of same batch may not have shown the foam to have shrunk back from liner as the product was used before foam had shrunk back. This level of difference between blue liner and foam length is considered inherent in process.
